

ABSTRACT OF THE DISCLOSURE

5 An outdoor stool system for providing a portable seating structure capable of
being utilized in various ground surface conditions. The outdoor stool system includes
an elongate support member, a seat shaft slidably positioned within the support
member, a seat member attached to the seat shaft, and a self-deploying base support
that has a compact storage structure. The base support is comprised of a spike member
10 along with a first member and a second member pivotally attached to a lower collar.
The first member and the second member pivotally extend outwardly when the spike
member is inserted into a ground surface thereby providing positional support to the
seat structure.
